

Why should I apply mulch to my garden?

Reduces water use, as it protects the soil from evaporation

Provides valuable nutrients to the soil

Reduces weeds

Adds a finished look to your garden

What do I need?

Wheelbarrow

Rake

Gloves

Weed mat (if desired)

Step 1: Clear the area

Remove all existing weeds, if you are spraying the existing weeds, wait until they die before applying the new mulch. This will reduce contamination.

Step 2: Fertilise

It is good to fertilise your plants before mulching, don't forget to water well. You can either use a slow release fertiliser or something organic, such as cow manure.

Step 3: Laying the mulch

The recommended depth of mulch to lay is 50mm, however the ideal depth is 75mm – 100mm. We recommend laying weed mat under your mulch to provide extra protection against weeds.

Tip:

Pull the mulch away from the plants stem and trunks to allow a clear airflow. Contact can cause moisture build up resulting in stem rot.

Our Range Of Mulch and Woodchip

Cypress Pine Chip

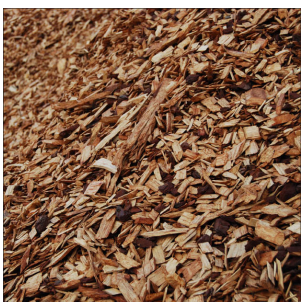

Eucalyptus Mulch

Red Wood Chip

Uni Mulch

Pine Chip

Midnight Mulch

Cypress Pine Bark

Leaf Mulch

Pine Bark

Lucerne Nutri Mulch

Woodchip
